Computer Networks Jacobs University Bremen Dr. Jürgen Schönwälder

## **CN Problem Sheet #1**

## Problem 1.1: measurements with ping and traceroute

(1+1 = 2 points)

Course: CO20-320301

Date: 2017-02-10

Due: 2017-02-17

Do this experiment over IPv4. Make sure you force the usage of IPv4 in case you have both IPv4 and IPv6 connectivity.

- a) The ping utility can be used to measure the round-trip time between the host running ping and remote hosts. Use ping to measure the round-trip time to google.com, www.google.com, www.jacobs-university.de, and cnds.eecs.jacobs-university.de from a machine hooked to the campus network. Calculate the minimum round-trip time observed over a number of 10 samples.
  - What do you observe? (Note: The fping implementation can probe multiple hosts simultaneously.)
- b) The traceroute utility can trace the route packets take on the Internet. The mtr utility is a more modern implementation that can trace a route in a faster more aggressive way. Trace the routes to the destinations
  - google.com,
  - www.google.com,
  - www.jacobs-university.de, and
  - cnds.eecs.jacobs-university.de.

Enable the command line switch of your traceroute utility to lookup the autonomous system (AS) number of the IP addresses (-z for mtr). For each destination, write down the sequence of autonomous systems crossed (the so-called AS-path) and the number of nodes in each autonomous system.

## Problem 1.2: ripe stats

(2 points)

The RIPE Network Coordination Centre, the registrar responsible for Europe, is providing services that help troubleshooting Internet routing problems. The https://stat.ripe.net/ web site provide an easy to use interface to their information resources.

- a) Lookup the name of the organizations owning the AS numbers you observed in the previous exercise. Which of the five registries (ARIN, RIPE, APNIC, LACNIC, AFRINIC) did assign the AS numbers?
- b) Lookup the IPv6 prefix 2001:638:709::/48. Who is using this prefix? Is the prefix globally announced? If not, which prefix is announced?

For this problem and subsequent problems you need to install Mininet, which enables you to emulate a complete network on a single computer running Linux.

Once you have Mininet installed, run the point.py python script (sudo python point.py) to create a simple point-to-point topology.

```
#!/usr/bin/env python
 1
 2
    """ point.py:
 3
 4
        This mininet script creates a simple point-to-point topology:
5
 6
                  10 mbps
7
          h1 ----- h2
8
9
10
    from mininet.cli import CLI
11
    from mininet.net import Mininet
    from mininet.link import TCLink
12
13
    from mininet.topo import Topo
14
    from mininet.log import setLogLevel
15
16
    class PointToPoint(Topo):
17
        def __init__(self, **opts):
            Topo.__init__(self, **opts)
18
            h1 = self.addHost('h1')
19
            h2 = self.addHost('h2')
20
21
            self.addLink(h1, h2, bw=10)
22
23
    if __name__ == '__main__':
24
       setLogLevel('info')
25
26
        topo = PointToPoint()
27
        net = Mininet(topo=topo, link=TCLink,
                       autoSetMacs=True, autoStaticArp=True)
28
29
30
        net.start()
        CLI(net)
31
32
        net.stop()
```

The iperf utility for active data rate measurements between two hosts. On one host, you run an iperf server (iperf -s) and on the other host you run an iperf client (iperf -c < host >). Additional options control how long iperf is measuring the data rate (-t) and how frequently results are reported (-i).

- a) Within Mininet, run an iperf server on h2 (h2 iperf -s &) and measure the data rate of the link by running an iperf client on h1 (h1 iperf -c h2 -i 10 -t 60). Does the measured data rate match your expectations?
- b) Ping h2 from h1 while iperf measures the data rate and while there is no iperf measurement in the background. Is there a difference in the observed round-trip times? What is causing the delays (transmission delay or propagation delay or queuing delay)?

Run the star.py python script (sudo python star.py) to create a simple star topology.

```
#!/usr/bin/env python
 1
2
     """ star.py:
3
4
         This mininet script creates a simple star topology with a switch
5
         in the center:
6
7
           h1
                             h3
8
9
             10 \
                         /10 mbps
10
11
                     s1
12
             10 /
13
                         \10 mbps
14
15
           h2
                            h4
16
17
18
     from mininet.cli import CLI
19
     from mininet.net import Mininet
20
     from mininet.link import TCLink
21
     from mininet.topo import Topo
22
     from mininet.log import setLogLevel
23
24
     class Star(Topo):
25
         def __init__(self, **opts):
26
             Topo.__init__(self, **opts)
27
             h1 = self.addHost('h1')
             h2 = self.addHost('h2')
28
29
             h3 = self.addHost('h3')
30
             h4 = self.addHost('h4')
31
             s1 = self.addSwitch('s1')
             self.addLink(h1, s1, bw=10)
32
33
             self.addLink(h2, s1, bw=10)
34
             self.addLink(h3, s1, bw=10)
35
             self.addLink(h4, s1, bw=10)
36
     if __name__ == '__main__':
37
38
         setLogLevel('info')
39
40
         topo = Star()
         net = Mininet(topo=topo, link=TCLink,
41
42
                        autoSetMacs=True, autoStaticArp=True)
43
44
         net.start()
         CLI(net)
45
46
         net.stop()
```

- a) Run an iperf measurement between h1 and h2. While iperf is running, run ping between h3 and h4 and observe the round-trip times. Does the iperf measurement impact the observed round-trip times?
- b) Run an iperf measurement between h1 and h2 and another between h3 and h4. Do the two concurrent measurements impact each other?

Run the network.py python script (sudo python network.py) to create a network topology.

```
#!/usr/bin/env python
2
    """ network.py:
3
4
        This mininet script creates a switched multi-hop topology:
5
6
                           h3
                                            h5
                                                              h7
7
          - 1
                                            - 1
         10|
